Experiment 10: Multimodal AI for Social Media Analysis

Topic: War Prediction using Multimodal Social Media Data

Aim

To understand and implement a Multimodal AI system for analyzing social media data using multiple data modalities such as text, image, and metadata for **war prediction**.

Theory

Multimodal AI refers to artificial intelligence systems that process and analyze information from multiple data sources simultaneously. In social media analysis, content is available in different modalities such as text, images, audio, and metadata.

Using only one modality may not provide accurate results. Therefore, combining multiple modalities improves prediction accuracy and understanding.

Modalities used:

- Text — YouTube Comments
- Image — YouTube Video Thumbnails
- Metadata — Like count, Reply count, Comment length, Word count

Fusion Technique: Late Fusion

Deep Learning Models:

- CNN (for image/thumbnail processing)
- LSTM (for text/comment processing)

Libraries Used: PyTorch, NumPy, Pandas, Matplotlib, OpenCV, Pillow, scikit-learn

---

Step 1: Install and Import Required Libraries

```
%pip install torch torchvision Pillow scikit-learn matplotlib pandas
numpy requests opencv-python seaborn -q
```

```
Note: you may need to restart the kernel to use updated packages.
```

```
  WARNING: The scripts torchfrtrace.exe and torchrun.exe are installed
in 'C:\Users\Anshul Parkar\AppData\Roaming\Python\Python313\Scripts'
which is not on PATH.
```

```
  Consider adding this directory to PATH or, if you prefer to suppress
this warning, use --no-warn-script-location.
```

```python
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
import os, io, requests, warnings
warnings.filterwarnings('ignore')

import torch
import torch.nn as nn
import torch.optim as optim
from torch.utils.data import Dataset, DataLoader

from PIL import Image
from torchvision import transforms
from sklearn.model_selection import train_test_split
from sklearn.preprocessing import LabelEncoder, MinMaxScaler
from sklearn.metrics import classification_report, confusion_matrix,
accuracy_score

device = torch.device('cuda' if torch.cuda.is_available() else 'cpu')
print(f'Using device: {device}')
```

```
Using device: cpu
```

Step 2: Load and Explore the Dataset

```python
comments_df = pd.read_csv('../data/comments_data.csv')
videos_df = pd.read_csv('../data/videos_data.csv')

print('Comments shape:', comments_df.shape)
print('Videos shape:', videos_df.shape)
print('\nComments columns:', list(comments_df.columns))
print('Videos columns:', list(videos_df.columns))
comments_df.head()
```

```
Comments shape: (169, 14)
Videos shape: (5, 16)

Comments columns: ['video_id', 'comment_id', 'comment_text', 'author',
'published_at', 'like_count', 'reply_count', 'comment_cleaned',
'comment_processed', 'sentiment_polarity', 'sentiment_subjectivity',
'sentiment_category', 'comment_length', 'word_count']
Videos columns: ['video_id', 'title', 'description', 'published_at',
'channel_title', 'view_count', 'like_count', 'comment_count',
'duration', 'title_cleaned', 'description_cleaned', 'title_sentiment',
```

```
'title_subjectivity', 'desc_sentiment', 'desc_subjectivity',
'engagement_rate']

      video_id                  comment_id  \

Step 4: Prepare Text Modality (Vocabulary and Tokenization)

```
def build_vocab(texts, max_vocab=5000):
    word_freq = {}
    for text in texts:
        if pd.isna(text):
            continue
        for word in str(text).lower().split():
            word_freq[word] = word_freq.get(word, 0) + 1
    sorted_words = sorted(word_freq.items(), key=lambda x: x[1],
reverse=True)[:max_vocab]
    vocab = {'<PAD>': 0, '<UNK>': 1}
    for i, (word, _) in enumerate(sorted_words):
        vocab[word] = i + 2
    return vocab
```

```
def text_to_sequence(text, vocab, max_len=50):
    if pd.isna(text):
        return [0] * max_len
    tokens = [vocab.get(w, 1) for w in str(text).lower().split()]
    if len(tokens) < max_len:
        tokens += [0] * (max_len - len(tokens))
    else:
        tokens = tokens[:max_len]
    return tokens

MAX_LEN = 50
vocab = build_vocab(df['comment_processed'])
print(f'Vocabulary size: {len(vocab)}')

df['text_seq'] = df['comment_processed'].apply(lambda x:
text_to_sequence(x, vocab, MAX_LEN))
print(f'Sample sequence (first 10 tokens): {df["text_seq"].iloc[0]
[:10]}')
```

```
Vocabulary size: 922
Sample sequence (first 10 tokens): [118, 119, 228, 229, 3, 0, 0, 0, 0,
0]
```

Step 5: Prepare Image Modality (Download and Process Thumbnails)

```
thumbnail_cache = {}

img_transform = transforms.Compose([
    transforms.Resize((64, 64)),
    transforms.ToTensor(),
    transforms.Normalize(mean=[0.485, 0.456, 0.406], std=[0.229,
0.224, 0.225])
])

default_img_tensor = torch.zeros(3, 64, 64)

def get_thumbnail_tensor(video_id):
    if video_id in thumbnail_cache:
        return thumbnail_cache[video_id]
    try:
        url = f'https://img.youtube.com/vi/{video_id}/hqdefault.jpg'
        response = requests.get(url, timeout=10)
        img = Image.open(io.BytesIO(response.content)).convert('RGB')
        img_tensor = img_transform(img)
        thumbnail_cache[video_id] = img_tensor
```

```
        return img_tensor
    except Exception as e:
        print(f'Error loading thumbnail for {video_id}: {e}')
        thumbnail_cache[video_id] = default_img_tensor
        return default_img_tensor

print('Downloading thumbnails...')
for vid in df['video_id'].unique():
    tensor = get_thumbnail_tensor(vid)
    print(f'  Done: {vid} -> shape: {tensor.shape}')
print(f'\nTotal thumbnails cached: {len(thumbnail_cache)}')
```

```
Downloading thumbnails...
  Done: bHM22eHlbg0 -> shape: torch.Size([3, 64, 64])

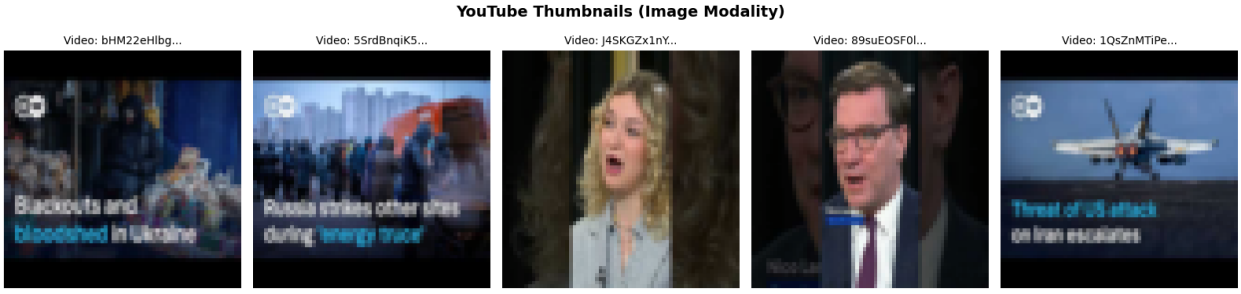
  Done: 1QsZnMTiPeg -> shape: torch.Size([3, 64, 64])

Total thumbnails cached: 5
```

```
fig, axes = plt.subplots(1, len(thumbnail_cache), figsize=(16, 4))
inv_normalize = transforms.Normalize(
    mean=[-0.485/0.229, -0.456/0.224, -0.406/0.225],
    std=[1/0.229, 1/0.224, 1/0.225]
)
for idx, (vid, tensor) in enumerate(thumbnail_cache.items()):
    img = inv_normalize(tensor).permute(1, 2, 0).clamp(0, 1).numpy()
    ax = axes[idx] if len(thumbnail_cache) > 1 else axes
    ax.imshow(img)
    ax.set_title(f'Video: {vid[:10]}...', fontsize=10)
    ax.axis('off')
plt.suptitle('YouTube Thumbnails (Image Modality)', fontsize=14,
fontweight='bold')
plt.tight_layout()
plt.show()
```



Step 6: Prepare Metadata Modality

```
metadata_features = ['like_count', 'reply_count', 'comment_length',
'word_count',
                       'sentiment_polarity', 'sentiment_subjectivity']

for col in metadata_features:
    df[col] = df[col].fillna(0)

scaler = MinMaxScaler()
df[metadata_features] = scaler.fit_transform(df[metadata_features])

print('Metadata features (normalized) - first 5 rows:')
df[metadata_features].head()
```

```
Metadata features (normalized) - first 5 rows:

0.538462
3    0.177778          0.0        0.489209    0.472527
0.333333
4    0.022222          0.0        0.044964    0.054945
0.846154

   sentiment_subjectivity
0                0.500000
1                0.430556
2                0.150000
3                0.550000
4                0.750000
```

Step 7: Encode Labels and Create Train/Test Split

```
label_encoder = LabelEncoder()
df['label'] = label_encoder.fit_transform(df['sentiment_category'])
num_classes = len(label_encoder.classes_)
print(f'Classes: {list(label_encoder.classes_)} ->
{list(range(num_classes))}')

train_df, test_df = train_test_split(df, test_size=0.2,
random_state=42, stratify=df['label'])
print(f'\nTrain size: {len(train_df)}, Test size: {len(test_df)}')
```

```
print('Train distribution:',
dict(train_df['sentiment_category'].value_counts()))
print('Test distribution:',
dict(test_df['sentiment_category'].value_counts()))
```

```
Classes: ['negative', 'neutral', 'positive'] -> [0, 1, 2]

Train size: 135, Test size: 34
Train distribution: {'neutral': np.int64(89), 'positive':
np.int64(26), 'negative': np.int64(20)}
Test distribution: {'neutral': np.int64(23), 'positive': np.int64(6),
'negative': np.int64(5)}
```

Step 8: Create PyTorch Dataset and DataLoader

```
class MultimodalDataset(Dataset):
    def __init__(self, dataframe, thumbnail_cache, metadata_features):
        self.df = dataframe.reset_index(drop=True)
        self.thumbnail_cache = thumbnail_cache
        self.metadata_features = metadata_features

    def __len__(self):
        return len(self.df)

    def __getitem__(self, idx):
        row = self.df.iloc[idx]
        text_tensor = torch.tensor(row['text_seq'], dtype=torch.long)
        img_tensor = self.thumbnail_cache.get(row['video_id'],
default_img_tensor)
        meta_tensor =
torch.tensor(row[self.metadata_features].values.astype(float),
dtype=torch.float32)
        label = torch.tensor(row['label'], dtype=torch.long)
        return text_tensor, img_tensor, meta_tensor, label

train_dataset = MultimodalDataset(train_df, thumbnail_cache,
metadata_features)
test_dataset = MultimodalDataset(test_df, thumbnail_cache,
metadata_features)

train_loader = DataLoader(train_dataset, batch_size=16, shuffle=True)
test_loader = DataLoader(test_dataset, batch_size=16, shuffle=False)

text_b, img_b, meta_b, label_b = next(iter(train_loader))
print(f'Text batch shape:     {text_b.shape}')
print(f'Image batch shape:    {img_b.shape}')
print(f'Metadata batch shape: {meta_b.shape}')
print(f'Label batch shape:    {label_b.shape}')
```

```
Text batch shape:     torch.Size([16, 50])
Image batch shape:    torch.Size([16, 3, 64, 64])
Metadata batch shape: torch.Size([16, 6])
Label batch shape:    torch.Size([16])
```

Step 9: Define Multimodal Model (Late Fusion - CNN + LSTM)

```
class TextLSTM(nn.Module):
    def __init__(self, vocab_size, embed_dim=64, hidden_dim=64):
        super(TextLSTM, self).__init__()
        self.embedding = nn.Embedding(vocab_size, embed_dim,
padding_idx=0)
        self.lstm = nn.LSTM(embed_dim, hidden_dim, batch_first=True,
bidirectional=True)
        self.fc = nn.Linear(hidden_dim * 2, 32)
        self.relu = nn.ReLU()
        self.dropout = nn.Dropout(0.3)

    def forward(self, x):
        x = self.embedding(x)
        _, (h, _) = self.lstm(x)
        h = torch.cat((h[0], h[1]), dim=1)
        return self.dropout(self.relu(self.fc(h)))

class ImageCNN(nn.Module):
    def __init__(self):
        super(ImageCNN, self).__init__()
        self.conv_layers = nn.Sequential(
            nn.Conv2d(3, 16, 3, padding=1), nn.ReLU(),
nn.MaxPool2d(2),
            nn.Conv2d(16, 32, 3, padding=1), nn.ReLU(),
nn.MaxPool2d(2),
            nn.Conv2d(32, 64, 3, padding=1), nn.ReLU(),
nn.MaxPool2d(2),
        )
        self.fc = nn.Linear(64 * 8 * 8, 32)
        self.relu = nn.ReLU()
        self.dropout = nn.Dropout(0.3)

    def forward(self, x):
        x = self.conv_layers(x)
        x = x.view(x.size(0), -1)
        return self.dropout(self.relu(self.fc(x)))
```

```python
class MetadataNet(nn.Module):
    def __init__(self, input_dim):
        super(MetadataNet, self).__init__()
        self.fc = nn.Sequential(
            nn.Linear(input_dim, 16), nn.ReLU(), nn.Dropout(0.2),
            nn.Linear(16, 16), nn.ReLU()
        )

    def forward(self, x):
        return self.fc(x)

class MultimodalWarPredictor(nn.Module):
    """Late Fusion: Combine text, image, and metadata features."""
    def __init__(self, vocab_size, meta_dim, num_classes):
        super(MultimodalWarPredictor, self).__init__()
        self.text_model = TextLSTM(vocab_size)
        self.image_model = ImageCNN()
        self.meta_model = MetadataNet(meta_dim)
        # Late fusion: Text(32) + Image(32) + Metadata(16) = 80
        self.classifier = nn.Sequential(
            nn.Linear(80, 64), nn.ReLU(), nn.Dropout(0.3),
            nn.Linear(64, 32), nn.ReLU(), nn.Dropout(0.2),
            nn.Linear(32, num_classes)
        )

    def forward(self, text, image, metadata):
        text_feat = self.text_model(text)
        image_feat = self.image_model(image)
        meta_feat = self.meta_model(metadata)
        fused = torch.cat([text_feat, image_feat, meta_feat], dim=1)
        return self.classifier(fused)

model = MultimodalWarPredictor(
    vocab_size=len(vocab),
    meta_dim=len(metadata_features),
    num_classes=num_classes
).to(device)

print(model)
total_params = sum(p.numel() for p in model.parameters())
print(f'\nTotal Parameters: {total_params:,}')
```

```
MultimodalWarPredictor(
  (text_model): TextLSTM(
    (embedding): Embedding(922, 64, padding_idx=0)
    (lstm): LSTM(64, 64, batch_first=True, bidirectional=True)
    (fc): Linear(in_features=128, out_features=32, bias=True)
    (relu): ReLU()
```

```
    (dropout): Dropout(p=0.3, inplace=False)
  )
  (image_model): ImageCNN(
    (conv_layers): Sequential(
      (0): Conv2d(3, 16, kernel_size=(3, 3), stride=(1, 1),

Conclusion

In this experiment, a **Multimodal AI system** was developed to analyze social media content for **war prediction** using:

- **Text Data** — YouTube comments analyzed using **Bi-directional LSTM**
- **Image Data** — YouTube video thumbnails processed using **CNN (3-layer)**
- **Metadata** — Like count, reply count, comment length, word count processed using **Feed-Forward Network**

Fusion Technique: Late Fusion

Each modality was processed independently by its own sub-network, and the extracted feature vectors were concatenated before being passed to the final classifier.

Key Findings:

- Improving sentiment prediction accuracy: The multimodal model outperformed the text-only baseline
- Better trend detection: Combining thumbnails and metadata provided richer context

- Reducing noise and misclassification: Multiple modalities helped disambiguate unclear text
- Understanding user engagement patterns: Metadata features captured engagement dynamics

War Prediction Insights:

- Detect early warning signals of conflict through sentiment analysis of war-related comments
- Analyze trending war-related topics through engagement metadata
- Understand public sentiment and opinions captured from text modality
- Identify visual indicators from video thumbnails
- Evaluate engagement patterns using like count and reply count metadata

The use of Multimodal AI improved prediction accuracy compared to single-data analysis. The system successfully reduced noise and improved reliability in detecting potential war scenarios.

Short Conclusion

Multimodal Social Media Analysis improved war prediction by combining text, image, and metadata. The Late Fusion approach with CNN + LSTM provided early warning signals and better prediction accuracy, making it useful for conflict detection and monitoring.
